

OPTIMISER LE BIEN COMMUN SANS REDISTRIBUTION DE RICHESSE

Bundit Laekhanukit¹, Guylain Naves², Adrian Vetta¹²

Septembre 2012, LIF, Marseille

¹School of Computer Science, McGill University

²Dpt. of Mathematics and Statistics, McGill University

Exemple 1: un petit marché.

i	e_i			u_i			x_i		
1	1	-	-	-	1	-	-	1	-
2	-	1	-	2	-	1	0.5	-	1
3	-	-	1	1	-	-	0.5	-	-

Exemple 1 bis: un petit marché.

i	e_i			u_i			x_i		
1	1	-	-	-	1	-	-	1	-
2	-	1	-	20	-	1	0.95	-	1
3	-	-	1	1	-	-	0.05	-	-

Exemple 2 : un ensemble super-autosuffisant.

Exemple 3 : un marché difficile à partitionner.

i	u_i				e_i			
1	1	1	1	1	1	-	-	-
1	-	1	1	1	-	1	-	-
1	-	-	1	1	-	-	1	-
1	-	-	-	1	-	-	-	1

Exemple 2 : un ensemble super-autosuffisant.

Exemple 4 : ratio de partitionnement.

i	e_i		u_i	
1	L	-	-	1
2	1	-	-	L^2
3	-	1	1	-

Example 5 : ratio de redistribution.

i	e_i		u_i	
1	1	-	-	L^2
2	-	1	1	L

Exemple 6 : prix exponentiels
